SMARTCELL INSIGHT

Big data Wi-Fi analytics reporting engine purpose built for enterprise and service provider networks

DATA SHEET

BENEFITS

SCALABLE

The SmartCell Insight platform brings Big Data technology to Wi-Fi reporting and analytics through its ability to process massively large amounts of network metrics – up to 100,000 APs. Clustering VM service systems allows for massive scaling of the analytics scope.

FLEXIBLE

Generates reports locally and can export data to upstream OSS and BSS systems for maximum operations flexibility.

STANDARD REPORTS

There is a huge inventory of predefined standard reports to get visibility into Wi-Fi network health, performance and Key Performance Indicators (KPI). These reports can be run on a defined schedule to simplify SCI configuration management.

DATA EXPLORER SERVICE

Any industry standard browser can be used to slice and dice the network analytics data to create custom reports utilizing Key Performance Indicators (KPIs) that reside in network archives on the SCI platform.

EASE OF USE

The base VM design removes scaling limitations when additional capacity is required. There are no hardware appliance requirements. The capacity of SCI can be increased by adding new VMs to SCI and does not need a rip-andreplace to increase capacity.

APPLICATION EXTENSIBLE

SCI delivers a set of APIs which can be used to construct custom applications based on the contents of the SCI analytics database.

EXPANDING LARGE SCALE WI-FI ANALYTICS REPORTING

Ruckus SmartCell[™] Insight (SCI) is a Big Data Wi-Fi analytics reporting engine designed for service providers and large enterprises to make informed business decisions regarding the health, operation and performance of their Wi-Fi networks. This service makes use of Big Data technology and storage innovations found in columnar database repositories, which greatly enhance the scale and performance of a system when used to process historical data.

THE SCI ARCHITECTURE

Figure 1 – Ruckus SmartCell Insight Architecture

Figure 1 provides an overview of the SCI architecture. And as a VM based application, SCI provides four major functions:

- Network analytics aggregation within the defined reporting scope, SCI interacts with APs and controllers to collect and archive key network metrics that become the backbone of the reporting capability.
- Monitor and report network status based on established profiles, policies and standard reports, SCI automatically collects network data and generates the defined output.
- Data Explorer a tool to create, customize and tailor reports to focus on the precise network metrics/trends to aid monitoring of the network.
- Export Analytics SCI has built-in APIs that support straightforward exporting analytics to OSS/BSS systems that maybe part of the customer's network. Reports can also be scheduled to be auto-delivered through e-mail in PDF and CSV formats

The Ruckus SCI platform transforms traditional network reporting into a vital business tool by collecting, analyzing, parsing, reporting, and storing unprecedented amounts of user, traffic, session and application information. Data from the largest networks can be stored and retrieved for up to 5 years.

STANDARDIZED SCI REPORTS

SCI ships with a set of standard reports that address the most common use cases faced by today's large network operations team. There is an easy to use and elaborate filtering mechanism built into the SCI that allows customers to generate more specifically targeted reports. These reports can be printed, emailed, or copied to a PDF file. The following section looks at sample reports from each category.

USER ACTIVITY

Traffic reports include: client fingerprint (iOS, Android, Windows, etc.), client health, number of sessions, number of unique devices, session bytes transferred, session duration, and top clients by traffic volume.

OPERATIONAL REPORTS

Operational reports can be used to look at how the various elements in the network are performing.

Figure 3 - Network activity - top ten APs by traffic

INVENTORY REPORTS

Inventory reports provide a mechanism to easily keep track of all the Wi-Fi assets in the network. These reports can be used to provide: access point inventory, WLAN controller inventory, and session inventory. Ruckus SCI collects and aggregates statistics from up to hundreds of thousands of Ruckus access points (APs), providing information such as upstream and downstream traffic demand, number of sessions, unique clients, or even the throughput customers can expect to achieve over periods of time on a per-AP basis. Now, network managers can quickly determine who is on their Wi-Fi network, what they are doing, when they are doing it, and from where; all graphically displayed in a simple format in a selection of views and customized reports.

For example, customers can get reports on the amount of traffic flowing through the network or any portion of the network, all the way down to the individual AP. This has never been possible on such a large scale as required by worldwide service providers, who are dealing with millions of devices.

As a VM application, SCI can be easily installed virtually anywhere within a provider's infrastructure, integrating directly with existing OSS/BSS systems via northbound APIs.

TRAFFIC REPORTS

Traffic reports include: access point traffic, client potential throughput, throughput estimate of clients, top APs by traffic volume, and top client devices by traffic volume. (Figure 5)

Index	AP Name	AP IP Address	Controller Name	Rx Tc	stal	т	c Total	Total	Traffic	Clients

Figure 5 - Top APs by Traffic Data Explorer Reports

SMARTCELL INSIGHT Big data Wi-Fi analytics reporting engine purpose built for enterprise and service provider networks

DATA EXPLORER REPORTS

Easily generated from any standard browser, these custom reports make use of the broad range of network analytics archived in the SCI database. By defining the relationship and scope (e.g., AP, date, time, or other metrics) of selected elements and associated hierarchical order, reports can be generated to monitor almost any conceivable network analytic dynamic. This greatly enhances the value of SCI as it allows different groups within an organization to display data in ways that are most meaningful to their particular situation. The Data Explorer uses a very intuitive drag and drop interface allowing any user to create new reports in a matter of minutes. (Figure 6)

AIRTIME UTILIZATION REPORTS

Wireless is shared medium by all clients, APs and other wireless devices. RF interference, number of clients, number of APs and other wireless devices affect the RF airtime utilization. Airtime utilization will provide visibility in to the utilization of 2.4GHz and 5GHz radios. You will be able to get airtime utilization at high level for overall network, as well as on per-radio at detailed level. You will be able to see trends and changes of Airtime utilization over time (Figure 7).

Figure 7 - Airtime Utilization Report

TOP APPLICATIONS BY TRAFFIC

Application visibility report will give visibility into usage of different applications in your network. You will able to find the top applications that are hogging the network bandwidth and applications that are heavily used. You will be able to get deeper insights into the usage of different applications (Figure 8).

lications by Traffic						These applications	consume 0% (14	(0B) of the total traffic (2 PB).	Top 10 Application	ms *

GREATER NETWORK VISIBILITY

Getting the most from a large Wi-Fi network, once deployed, requires clear visibility into its performance and user activity, both at a very granular level of detail as well as aggregated level to measure global trends potentially spanning years.

SCI leverages two emerging trends:

Mobile Internet usage patterns which are evolving rapidly. The visibility required to address these changes must extend beyond typical short-horizon EMS/NMS health and statistics to enable long-term trend analysis that supports network and service evolution planning. With exploding volumes of users, devices, traffic, and access points, this requirement spells a real scaling challenge for any network measurement and assessment tool.

Emergence of Big Data brought to market by many popular applications that facilitate the collection, storage, and efficient retrieval and analysis of massive amounts of data. This technology, built into SCI, results in a comprehensive offering that can accommodate additional capabilities in future releases.

These two trends are integrated into the Ruckus SCI as a whole new approach to measurement and assessment, designed specifically to provide the visibility, trend analysis, and raw scale required to successfully manage a carrier-sized Wi-Fi network.

Description
VMware Amazon Web Services KVM
 Analytics aggregation Network monitor & reporting Creation of custom reports (Data Explorer) Export Analytics
Virtual limitless management capacity
Standard Reports
Reporting total APs and Controllers under management
Reporting maximum and minimum statistics in various categories
Reporting client type, health, number and duration of sessions
Total traffic by AP and client as defined by report scope

Table 1 - SCI Feature Summary

SCI has been redesigned to make it simpler to trial, deploy and expand. The licensing has been changed to take advantage of the VM-based architecture, providing virtually limitless scaling utilizing "clustering" of VM resources. Additionally, support for APs can be purchased on individual basis and not in large, arbitrary block-order sizes. This allows a customer to deploy small pilot sites and then expand service solely based on the aggregate number of APs to support.

Trials are even simpler with the ability to download the trial SCI, install and operate it for 90 days with no limitation on features and number of APs being evaluated. This provides a straightforward opportunity to validate a complete site at no cost at all – no risk at all.

PRODUCT ORDERING INFORMATION

Model SKU	Description
Smartcell Insight	
L09-SCIP-WW00	SmartCell Insight VM application license rights
L09-0001-SCIW	SmartCell Insight one AP service license

SCI installs require one Master Node and can be scaled by adding additional Data Nodes.

	Master Node	Data Node				
vCPU	8	4				
Memory	32GB	20GB				
Root HDD	80GB	80GB				
Secondary Data HDD	500GB	500GB				
Required data storage is 1 GB per 1.000 APs per day						

Table 3 - Virtual Machine Specifications
